CAREER PROFILE

- Final-year IT student at UTS majoring in Enterprise Software Development, with an Information Security sub-major, graduating November 2026 with a Distinction average.
- Back-end-focused full-stack developer with hands-on experience in Spring Boot, Java servlets/JDBC, and React/TypeScript, and a working habit of pairing feature work with unit tests and CI/CD.
- Owned the authentication and registration module of a full-stack Spring Boot application end to end DTO-based REST endpoints, password validation, JUnit/Mockito test coverage, and an Azure CI pipeline.
- Built and tested a role-based access control module using parameterised SQL queries to prevent injection, covering the data-access layer with JUnit and Mockito.
- A strong problem-solver and quick, self-directed learner, comfortable owning a feature from the data layer through to the UI and picking up new tools and stacks fast.

EDUCATION

Bachelor of Information Technology (Enterprise Software Development) | Feb 2024 – Nov 2026 (*Expected*)

University of Technology Sydney (UTS) · Distinction Average

- Relevant Subjects: Data Structures & Algorithms, Enterprise Application Development, Software Architecture & Design, Cloud Computing & SaaS, Cybersecurity Fundamentals, Data Analytics

TECHNICAL SKILLS

Languages	Java, SQL, TypeScript, JavaScript, Python, HTML & CSS
Frameworks	Spring Boot, React, Java MVC, Jakarta Servlets & JSP, JavaFX
Databases	MySQL, SQLite, PostgreSQL (coursework)
Tools	Git & GitHub, Maven, JUnit, Mockito, Azure DevOps, Microsoft Azure, CI/CD Pipelines, IntelliJ IDEA, VS Code
Concepts	REST APIs, Backend Development, Unit & Integration Testing, Role-Based Access Control, OOP, MVC Architecture, Database Design, Agile / Scrum

RELEVANT PROJECTS

Le Restaurant – Restaurant Management System (Team Project) | Java · Spring Boot · React · TypeScript · Azure Pipelines | 2025

- Owned the user authentication and registration features of a full-stack team application, building the Spring Boot REST backend (controller → service layering with DTO-based JSON request/response) and the React and TypeScript login and registration UI.
- Added password-validation rules and tightened authentication error handling so invalid input and failed logins returned clear, correct API responses.
- Wrote unit tests across the auth controller, service, and validator with JUnit and Mockito, covering normal and edge cases, and updated the Azure CI pipeline to run them automatically before merge.

IoTBay – Online IoT Device Store (Team Project) | Java · Jakarta Servlets · JSP · JDBC · MySQL | 2025

- Built the admin user-management module of a Java servlet/JSP web application as part of a four-person team, implementing server-side create, update, and delete operations for customer and staff accounts through a JDBC data-access layer.
- Enforced role-based access control so only admin accounts could add, deactivate, or remove users, redirecting unauthorized requests, and added account activate/deactivate handling and name-based user search.
- Wrote all user queries as parameterised prepared statements to guard against SQL injection, and covered the user data-access layer with JUnit and Mockito unit tests.

Asquith Doctors – Medical Practice Website (Solo Project) | React · JavaScript · HTML/CSS | 2024

- Designed and built a responsive website for a medical practice, solo, covering separate navigation paths for patients and staff/employees.
- Built an appointment booking flow in React with form validation and persistence to local storage, allowing patients to book and view appointments without a backend.

- Focused on usability for two distinct user types, structuring the site so patients and staff could each find relevant information and actions without unnecessary navigation.

Event Management & Ticketing System | *Java · MVC · OOP · SQL* | 2025

- Developed a backend-driven event booking platform in Java using MVC architecture and SQL databases, supporting authentication, ticket purchasing, event management, and role-based access control.
- Separated business logic, presentation, and data access layers to keep the codebase clean and maintainable as new event types and access roles were added, with no structural overhaul needed.

Cybersecurity Case Study – MOVEit Transfer Zero-Day (2023) | *Threat Analysis · Security Planning · Technical Report* | 2025

- Analysed the MOVEit Transfer zero-day vulnerability in depth how it was exploited, which organisations were affected, and what the real-world impact looked like across sectors.
- Researched the attack vector, assessed risk exposure, and proposed a layered defence and mitigation strategy, communicating findings through a structured technical report and video presentation.

Cloud Computing & SaaS – Microsoft Azure Deployment | *Azure · CI/CD · Cloud Infrastructure* | 2024

- Deployed cloud applications on Microsoft Azure from scratch, configuring infrastructure and setting up CI/CD pipelines to automate testing and delivery across the deployment workflow.
- Assessed cloud performance, cost trade-offs, and security controls within a live Azure environment, applying scalability and optimisation principles aligned with enterprise and SaaS system requirements.

Personal Portfolio Website | *Vite · React · TypeScript* | 2024–2026

- Designed and built a fully responsive personal portfolio and blog site with light/dark mode, a downloadable resume, and project cards showing personal ownership within each team project.
- Applied core frontend principles responsive layout, semantic structure, and consistent visual styling — deployed and version-controlled through GitHub.

PROFESSIONAL DEVELOPMENT

- IT Professionals Australia – Student Member · 2025 – Present
- AWS Cloud Practitioner – In Progress
